

A new species of *Matthiola* R. Br. (Brassicaceae) from Turkey

TUNCAY DIRMENCI¹*, FATİH SATİL² and GÜLENDAM TÜMEN²

¹Balıkesir University, Necatibey Education Faculty, Department of Biology Education, 10100 Balıkesir, Turkey

²Balıkesir University, Faculty of Science and Arts, Department of Biology, 10100 Balıkesir, Turkey

Received January 2005; accepted for publication November 2005

A new species, *Matthiola trojana* T. Dirmenci, F. Satılı & G. Tümen (Brassicaceae), is described from Turkey. Diagnostic characters, description, detailed illustrations, and taxonomic comments are given. Its characteristics are compared with the related species, *M. fruticulosa* (L.) Maire. The geographical distribution of the new species is mapped. The World Conservation Union (IUCN) threat category and observations on the population are noted. © 2006 The Linnean Society of London, *Botanical Journal of the Linnean Society*, 2006, **151**, 431–435.

ADDITIONAL KEYWORDS: endemic – Kazdağ – *Matthiola fruticulosa* – taxonomy.

INTRODUCTION

Some *Matthiola* R. Br. specimens were collected from B1 Balıkesir province during the Project of Flowering Plants of Kazdağ National Park supported by the TUBİTAK/YDABAG. They were similar to *Matthiola fruticulosa* (L.) Maire, but could not be identified using the *Flora of Turkey* (Cullen, 1965). After a thorough examination of all Turkish *Matthiola* sp. in herbaria (ANK, GAZI, HUB, ISTE) and consultation of the relevant literature (Ball, 1993; Cullen, 1965; Franzen, 1986; Davis, Mill & Tan, 1988; Livaniou-Tiniakou, 2002), it was concluded that the Balıkesir specimens represented a hitherto undescribed species. The total number of *Matthiola* species known from Turkey is now ten.

MATTHIOLA TROJANA T. DIRMENCI, F. SATİL & G. TÜMEN, SP. NOV. (FIGS 1, 2)

Diagnosis: Similis *M. fruticulosa* (L.) Maire sed caulis brevibus, 2–9 cm (non 15–60 cm), foliis pin-

natisectis (non integris vel sinuatis), siliquae falcate differt.

Type: [Turkey]: B1 Balıkesir, Edremit, Kazdağ (Ida), Nanekırı place, rocky slopes, limestone, 1550 m, 5.vi.2004, T. Dirmenci (2522) & F. Satılı (holo: ISTE, iso: ANK, EGE, GAZI).

Description: Caespitose perennial, scapose, woody at the base. STEM erect or ascending (2–) 3–9 cm, unbranched, stellate and dendroid hairy with sparse to dense minute yellowish glands. BASAL LEAVES (8–) 10–30 (–40) × 1–4.5 mm, linear-lanceolate to lanceolate in outline, pinnatipartite to pinnatisect, acute to obtuse, stellate and dendroid hairy with minute yellowish glands, lateral lobes triangular to lanceolate, up to 4 mm. INFLORESCENCE a raceme, up to 5 cm, 3–10 flowered. Pedicel short, elongating to 4 mm in fruit. SEPALS 8–11 × 1.5–2 mm, oblong, acute to obtuse, outer sepals saccate, stellate hairy with sparsely minute yellowish glands, scarious margin 0.1–0.2 mm. PETALS pinkish to purplish, often turning brownish when dried, 14–18 × 3–5 mm, glabrous, obovate, rounded or rarely slightly emerginate at apex, clearly undulate and sometimes circinnately rolled. Siliqua (30–) 35–70 × 1.4–1.6 mm, terete, spreading, falcate, stellate hairy with minute yellowish glands. Stigma to

*Corresponding author. E-mail: dirmenci@balikesir.edu.tr

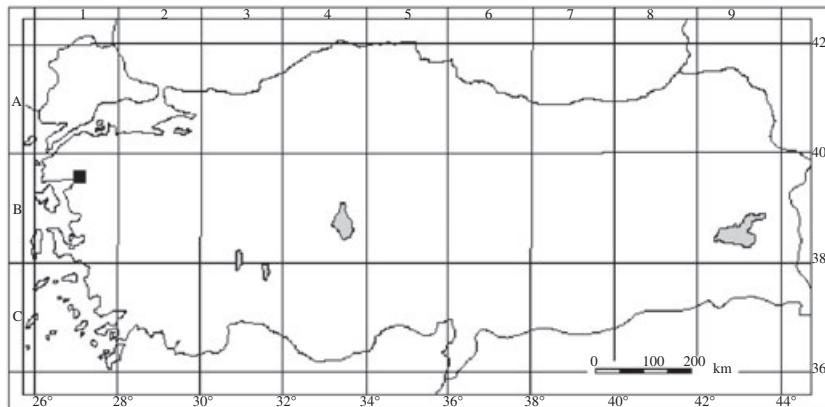

Figure 1. Distribution map of *Matthiola trojana* (■) in Turkey.

0.5 mm, narrower than siliqua, horns absent or if present not more than 0.5 mm, valves clearly 1-veined. SEEDS 2–2.5 × 1–1.2 mm, oblong, winged, brownish.

Phenology: Flowering and fruiting June–July.

Habitat: Open rocky slopes in *P. nigra* forests, 1550–1600 m.

Material examined: [Turkey] B1 Balıkesir: Edremit, Kazdağ (Ida), Nanekırı place, limestone, 1600 m, 30.vi.2004, T. Dirmenci 2604 & F. Satılı; ibid, 09.viii.2004, T. Dirmenci 2927 & F. Satılı; ibid, 07.vi.2005, T. Dirmenci 3031; ibid, 20.vii.2005, T. Dirmenci 3082.

Etymology: The species epithet is taken from the name of the district in which it occurs.

Distribution and proposed conservation status: *Matthiola trojana* is endemic to Kazdağ (Ida)-Balıkesir, West Anatolia, and belongs to the Mediterranean element of the Turkish flora. It is known only from a single population at the type locality and from an area of approximately 5000 m². The population is not in good condition and the number of individuals is approximately 100–150. Therefore, it should be regarded as belonging to the World Conservation Union (IUCN) Critically Endangered (CR) threat category (IUCN, 2001).

Ecology: *Matthiola trojana* grows on open rocky slopes in *P. nigra* forests. Species growing with *M. trojana* at the type locality include: *Allium kurtzianum* Asch. & Sint., *Astragalus heldreichii* Boiss., *Astragalus idae* Sirj., *Centaurea odyssei* Wagenitz, *Cerasus prostrata* (Lab.) Ser. var. *prostrata*, *Dianthus*

erinaceus Boiss. var. *alpinus* Boiss., *Draba brunifolia* Stev. ssp. *olympica* (Sibth. ex DC.) Coode & Cullen, *Iberis saxatilis* L. ssp. *saxatilis*, *Onobrychis* sp., *Papaver strictum* Boiss. & Bal., *Salvia argentea* L., *Sedum album* L., *Sedum lydium* Boiss., *Sideritis trojana* Bornm., *Sorbus umbellata* (Desf.) Fritsch var. *cretica* (Lindl.) Schneider, and *Thymus sipyleus* Boiss. ssp. *sipyleus* var. *sipyleus*.

DISCUSSION

Matthiola trojana is endemic to Turkey and was collected from Balıkesir province by the authors. *M. trojana* is related to *M. fruticulosa* according to the *Flora of Turkey* (Cullen, 1965), *Flora of Europa* (Ball, 1993), and *Flora Hellenica* (Livaniou-Tiniakou, 2002).

Matthiola fruticulosa is morphologically very variable and was divided into the three subspecies *M. fruticulosa* ssp. *fruticulosa*, *M. fruticulosa* ssp. *valesiaca* (Gay ex Gaudin) P.W. Ball, and *M. fruticulosa* ssp. *perennis* (Conti) P.W. Ball in *Flora of Europa* (Ball, 1993) and *Flora Hellenica* (Livaniou-Tiniakou, 2002). Only one subspecies, *M. fruticulosa* ssp. *fruticulosa*, occurs in Turkey.

As shown in Table 1, *M. trojana* can be easily distinguished from *M. fruticulosa* ssp. *fruticulosa* by its short stems (2–) 3–9 cm [not (5–) 15–40 (–60) cm], unbranched (not laxly branched) and glandular stems (not eglandular), pinnatipartite to pinnatisect leaves (not entire to sinuate lobed), pedicel to 4 mm in fruit (not 0.5–1.5 mm), yellow glandular (not eglandular), spreading (not patent or deflexed) and falcate siliqua, valves clearly 1-veined (not 1–3-veined), and bigger seeds, 2–2.5 × 1–1.2 mm (not 1–1.5 × 0.8–1 mm).

Matthiola trojana is allied to *M. fruticulosa* ssp. *valesiaca*, but can be distinguished from ssp. *valesiaca*

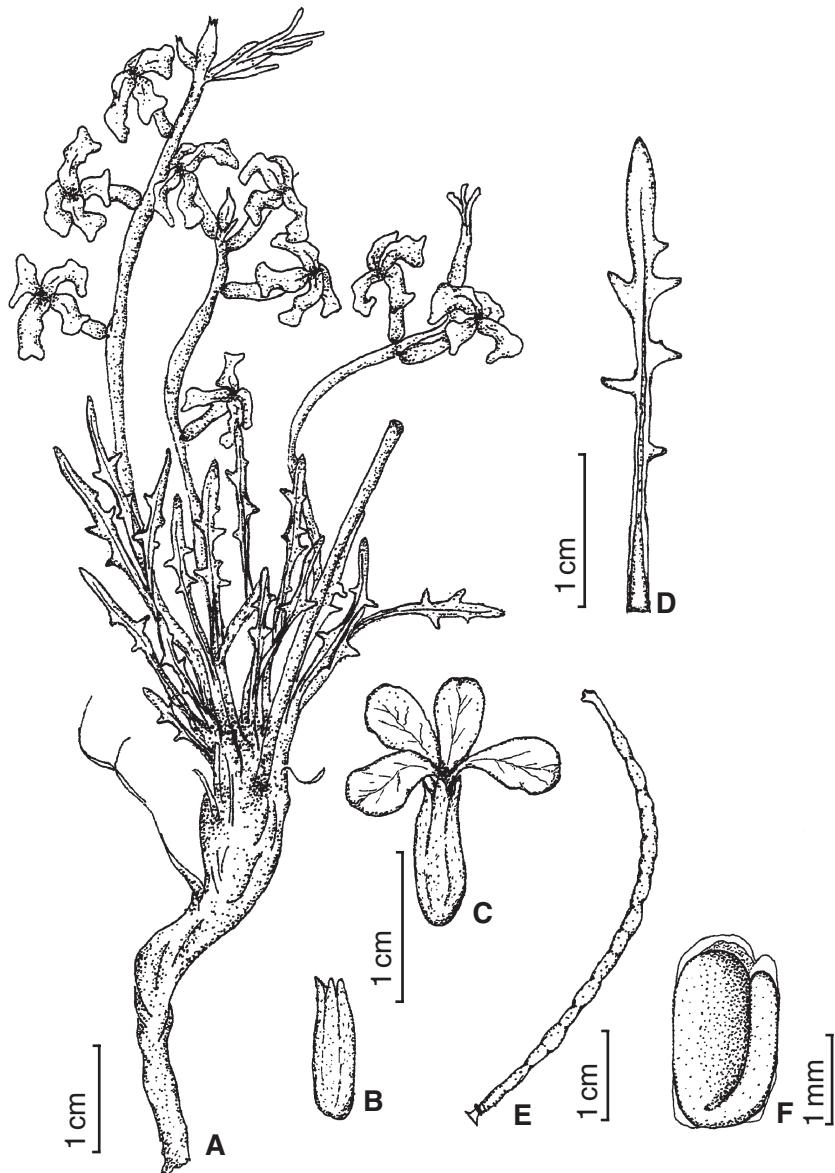

Figure 2. Illustration of *Matthiola trojana*: A, habit; B, calyx; C, flower; D, leaf; E, fruit; F, seed.

by its short stems (2–) 3–9 cm [not (6–) 15–40 (–60) cm], pinnatipartite to pinnatisect leaves (not entire to sinuate lobed) (Fig. 3), pedicel to 4 mm in fruit [not (0.5–) 1–2 mm], spreading (not ± erect) and falcate siliqua, valves clearly 1-veined (not 1–3-veined), and bigger seeds, 2–2.5 × 1–1.2 mm (not 1–1.5 × 1–1.5 mm).

It differs from *M. fruticulosa* ssp. *perennis* as follows: yellow glandular (not eglandular) and narrower siliqua, 1.4–1.6 mm (not 2–3 mm), valves clearly 1-veined (not 3–5-veined).

According to some morphological properties, *M. trojana* is allied to *M. fruticulosa*. However, it differs from *M. fruticulosa* in its shorter stems (less than

10 cm), pinnatipartite to pinnatisect leaves, and spreading and falcate siliqua.

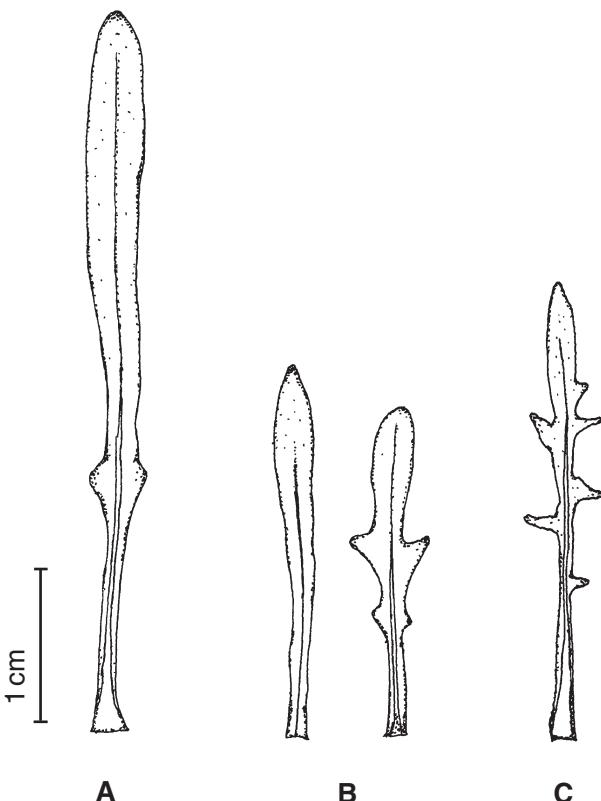

Because of the characters mentioned above, the Kazdag population is described as a species new to science.

ACKNOWLEDGEMENTS

We would like to thank Professor Dr Bayram Yildiz for useful discussions and for checking the Latin diagnosis, the curators of the herbaria E, G, W, ANK, GAZI, HUB, ISTE for allowing us to examine their *Matthiola* specimens in Europe and Turkey, and TUBITAK-YDABAG (103Y104) for funding this research.

Table 1. Characters used to distinguish between *Matthiola trojana* and *M. fruticulosa* ssp.

	<i>M. trojana</i>	<i>M. fruticulosa</i> ssp. <i>fruticulosa</i>	<i>M. fruticulosa</i> ssp. <i>valesiaca</i>	<i>M. fruticulosa</i> ssp. <i>perennis</i>
